

Software Engineering Graduate — London

Stanley Sarfo Peprah

I build Android apps with Kotlin and Firebase. Currently seeking my first junior developer role at a company where I can ship real things and keep growing.

ABOUT

I'm a recent BEng Software Engineering graduate from De Montfort University, targeting a first-class degree. My main focus is Android development — I've spent the past few years building full-stack mobile apps from scratch, owning everything from architecture through to testing on real hardware.

Outside of my main stack I'm building out passive income projects: Android utility apps, a TikTok content channel, and a SaaS cold

outreach tool. I'm interested in AI, music production, and anything at the intersection of tech and creativity.

Based in London. Open to junior and graduate developer roles, especially at startups, agencies, and product teams that move fast.

LANGUAGES

Kotlin Java XML SQL

ANDROID

Android Studio Jetpack Material Design App Remote SDK

BACKEND / CLOUD

Firebase Firestore Firebase Auth Spotify Web API REST APIs

TOOLS

Git GitHub IntelliJ Node.js

PROJECTS

VibeNSync

Final Year Dissertation — 2026

A full-stack social music Android app built in Kotlin. Features include a friend system with real-time activity feeds, Jaccard-based compatibility scoring, mood-based playlist generation via a custom Vibe Classifier, and Live Rooms for synchronised playback. Integrates the Spotify Web API and App Remote SDK via PKCE OAuth, backed by Firebase Firestore. Engineered a custom polling architecture (playAndConfirm) for reliable seek bar sync and auto-

advance queue logic. Managed the full development lifecycle and tested on physical hardware.

Kotlin Firebase Firestore Spotify API PKCE OAuth Jetpack

Completed

ColdCraft

SaaS Web App

An AI-powered cold outreach tool that generates personalised messages for job seekers and sales teams. Built with Node.js and Express on Replit, using a secure backend to call the Anthropic Claude API. Designed as a standalone SaaS product.

Node.js Express Anthropic API JavaScript

In Progress

@toldyou.daily

TikTok Content Channel

Automated daily TikTok channel posting Reddit story videos with AI voiceover and gameplay backgrounds. Built a custom AI video generation pipeline on Replit. Posting twice daily to test virality and validate the concept before building a full web app.

AI Automation Replit Content Creation

Active

Student Login & Module Selection

Desktop App — 2024

A Java Swing desktop application with tabbed navigation for student login, profile management, and module selection. Focused on clean UI design with input validation and smooth state transitions.

Java Swing OOP

Completed

Android Utility Apps

Passive Income Projects

Building a series of small, focused Android apps for the Play Store. Ideas in progress include a White Noise / Sleep Sounds app, a Shift Calculator / Work Hours Tracker, and an AI Revision Helper. Using RevenueCat, AdMob, and Firebase.

Kotlin Firebase RevenueCat AdMob

Planned

Smart Home Environmental Monitor

IoT / Embedded Systems — 2025

An IoT system built on NodeMCU ESP8266 with DHT11 temperature/humidity and HC-SR04 ultrasonic sensors, pushing live data to ThingSpeak and Blynk dashboards. Built as part of embedded systems coursework (CTEC3706).
